OPIOID OVERDOSE RESUSCITATION

Symptoms of an overdose:

- 1. Slow and shallow breathing.
- 2. Very sleepy and unable to talk, or unconscious.
- 3. Skin color is blue or grayish, with dark lips and fingernails.
- 4. Snoring or gurgling sounds.

If there are symptoms of an overdose:

- 1. Lightly tap, shake, and shout at the person to get a response. If there is still no response, rub knuckles on the breast bone.
- 2. If the person responds, keep them awake.
- 3. Call 911.

If you get little or no response:

- 1. Call 911.*
- 2. If their breathing is shallow or non-existent, or if the skin color is blue or grayish, with dark lips and fingernails, perform mouth-to-mouth rescue breathing by tilting head back and lifting up chin until mouth opens, clearing airway. Give two quick breaths to start and then a strong breath every 5 seconds.
- 3. If the person no longer has a heartbeat (pulse), continue to perform rescue breathing. Perform CPR by pushing hard on the chest bone at a rate of 100 times per minute.
- 4. Stay with the person. If you have to leave the person alone or vomiting occurs, place the person in the recovery position – on their side, hand supporting the head, mouth facing downward, and leg on the floor to keep the person from rolling onto stomach.
 - *If you have access to **naloxone** (also called **Narcan®** a medication that can rapidly reverse the overdose of opioids), administer it according to the package instructions, in addition to calling 911.

Perform mouth-to-mouth rescue breathing.

Perform chest compressions.

Place the person in the recovery position.
